

Geometry

Transversal Lines:

Some people love geometry, and others -- don't.

There are a lot of terms. There is a strong component of memorization. If you know the terms - this section is easy. If you do not take the time to learn them - this section will be difficult.

A **Transversal Line** is a line that crosses two other lines.

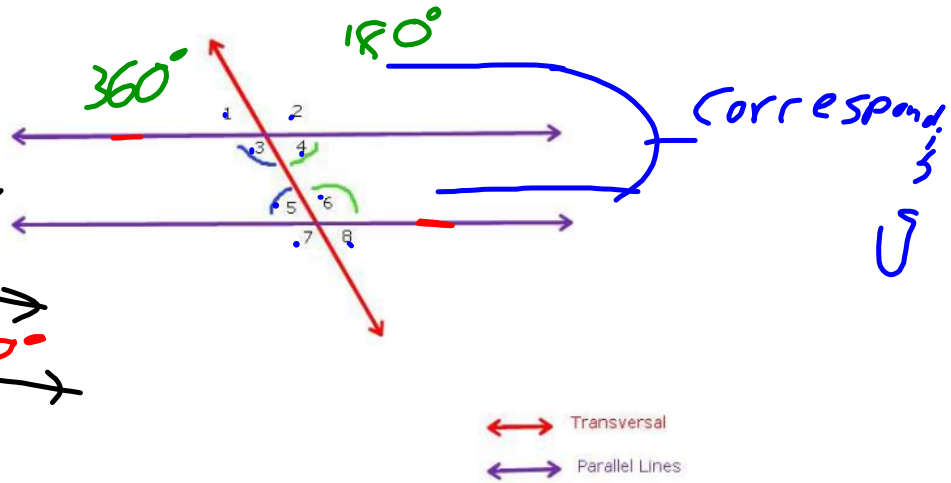

We will be most interested in when a transversal line crosses a set of parallel lines.

Interior Angles:

The angles formed inside the parallel lines.
In this case angles 3-6 are interior angles.

The Z rule.

Also note that $3 + 4 = 180^\circ$
 $5 + 6 = 180^\circ$

Exterior angles:

In the above case angles 1, 2, 7, 8 are exterior angles.

Also note that $1 + 2 = 180^\circ$
 $7 + 8 = 180^\circ$

Corresponding angles:

These angles are not adjacent and are on the same side of the transversal.

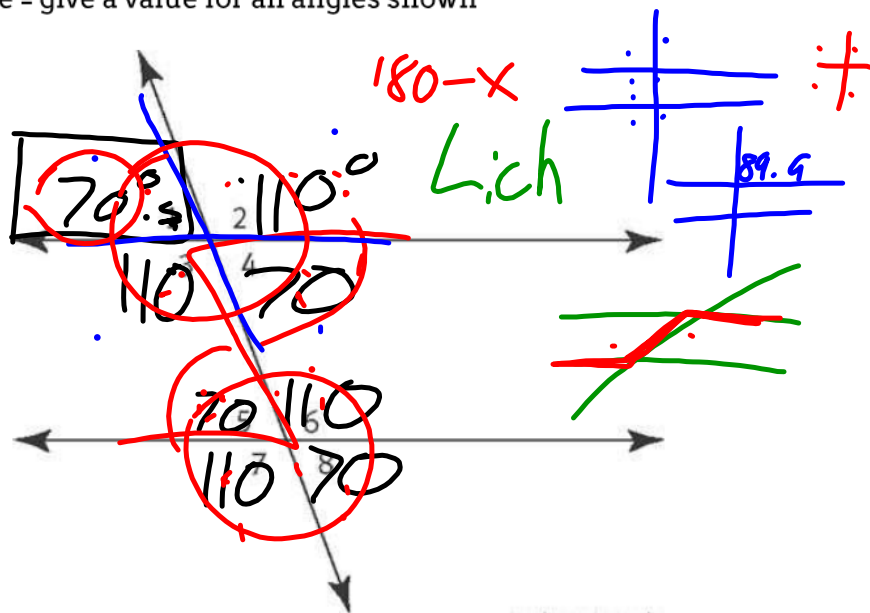

In the above case $2 = 6$
 $4 = 8$
 $1 = 5$
 $3 = 7$

Note:

These rules are ONLY true when the transverse line crosses parallel lines.

Let's try to solve a situation now:

Solve = give a value for all angles shown

That's it for today. Make sure you're comfortable with these terms.
