

Quadratic Functions in Standard Form

The standard form of a quadratic function is:

$$f(x) = Ax^2 + Bx + C$$

e.g. $3x^2 - 2x + 1$

Ex. #1: Use a table of values to sketch the graph of $y = x^2 + 6x + 5$ and answer the following questions.

Vertex: $(-3, -4)$

Axis of symmetry: $x = -3$

Direction of Opening: \uparrow

Max or Min: $\ominus 4$

Domain: $\{x | x \in \mathbb{R}\}$

Range: $\{y | y \geq -4, y \in \mathbb{R}\}$

x	$y = x^2 + 6x + 5$
0	5
1	12
-1	0
-2	-3
-3	-4
-4	-3

Vertex:

$$x = \frac{-b}{2a}$$

Ex. #2: Which functions are quadratic?

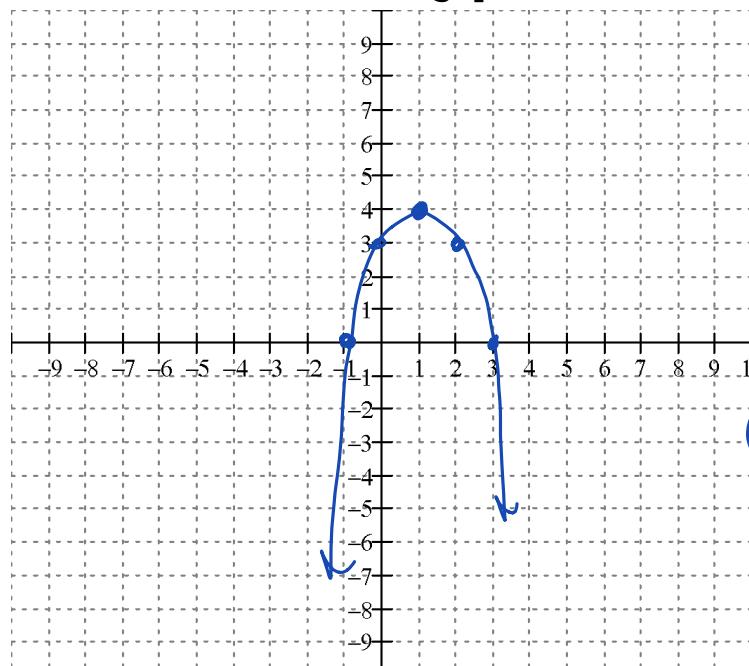

$$(a) y = (x - 2)(2x + 5)$$

$$\begin{aligned} &= 2x^2 + 5x - 4x - 10 \\ \rightarrow &= 2x^2 + x - 10 \end{aligned}$$

$$(b) f(x) = 2x^1 - 3$$

line

Ex. #3: Use a graphing calculator to sketch the graph of $y = -x^2 + 2x + 3$ and answer the following questions.

Vertex: (1, 4)

Axis of symmetry: $x = 1$

Direction of opening: down

Max or Min: @ $y = 4$

Domain: $\{x | x \in \mathbb{R}\}$

Range: $\{y | y \leq 4, y \in \mathbb{R}\}$

$$x = \frac{-b}{2a} = \frac{-2}{2(-1)} = 1$$
