

# Inverse Square Law

Wednesday, February 01, 2012 8:58 AM

This is a mathematical shortcut to make life easy for you involving ratios. It is useful any time a formula has some variable:

$Y = \frac{\#}{X^2}$

$y = \frac{1}{x^n}$   
*y is inversely proportional to  $x^2$*   
 $F_g = \frac{Gm_1m_2}{r^2}$   
 *$y \propto \frac{a}{x^2}$*

$\vec{g} = \frac{Gm}{r^2}$

$v = at$   
*v is proportional to time.*

$v/t = a$

Imagine some value of v, double the value you imagined, what happens to a?

$v \propto t$

Forget your chosen values for v, instead choose a value for t. Then double that value for t, what happens to a?

*if you double one, you double the other.*

$\vec{F}_e = \frac{kq_1q_2}{r^2}$   
 $\vec{E} = \frac{kq}{r^2}$

$\frac{F_c}{v^2} = m$  choose a value for v, that gives a value for m. double v what happens to m?

$F_c = ma$   
 $= m\left(\frac{v^2}{r}\right)$

$m = \frac{F_c r}{(2v)^2} \rightarrow \frac{1}{4}$

$F_g = \frac{Gm_1m_2}{r^2}$

Notice  $F_g$  depends on  $1/r^2$  any formula where a variable depends on

$1/x^2$  uses inverse square law.

Calculate the force of gravity on a 200 kg which is  $4 \times 10^8$  m from the center of the Earth.

$$F_g = \frac{6.67 \times 10^{-11} (200) (5.98 \times 10^{24})}{(4 \times 10^8)^2} = 5 \text{ N}$$

Inverse Square Law: a mathematical short cut to  $F_g$ ,  $g$ ,  $F_e$ ,  $E$ , Intensity

Cat on Earth's surface  $F_g = 500 \text{ N}$   
 If it is moved twice that distance  
 What is  $F_g$ ?

$$\frac{F_{g1}}{F_{g2}} = \frac{(2r_1)^2}{r_1^2}$$

$$\frac{500}{F_{g2}} = \frac{4r^2}{r^2}$$

$$F_{g2} = \frac{500}{4} = 125 \text{ N}$$

Calculate the force of gravity on the same object when at  $8 \times 10^8$  m from the Earth.

$$\frac{F_{g1}}{F_{g2}} = \frac{(2r)^2}{r^2}$$

$$\frac{.5}{F_{g2}} = \frac{4r^2}{r^2}$$

$$F_{g2} = \frac{.5}{4} = .125 \text{ N}$$

$$F_{g2} \quad r \quad F_{g2} = .125N$$

useful for finding the gravitational field (g)

An exoplanet has gravitational field of 15 N / kg at its surface. What will be its gravitational field strength at 3 radii from the center.

$$\vec{g} = \frac{Gm}{r^2}$$

hint:  $1.67 \frac{N}{kg}$

$$\frac{g_1}{g_2} = \frac{(3r)^2}{r^2}$$

$$\frac{15}{g_2} = \frac{9}{1}$$

$$g_2 = 1.67 \frac{N}{kg}$$

$$g_2 = \frac{Gm}{(3r)^2}$$

A star has a planet orbiting it, and experiences a force of gravity of  $5.0 \times 10^{40}$  N between the two. If the separation magically doubled how many times greater is  $F_{g1}$  compared to  $F_{g2}$ ?

and, what is  $F_{g2}$       hint:  $F_{g2} = 1.25 \times 10^{40}$

The force on a mass on Jupiters surface is 100N. What is the force at 5 times the distance?

hint: 4N

...

distance!

hint:  $4N$

$$\frac{100}{5^2} = 4$$

Inverse Square Law

Work from

$r \rightarrow 2r$

$\rightarrow$  Area under  
the graph

## Cool Question

Monday, April 18, 2016 10:45 AM

An Electric motor outputs 1500W of power  
Pulling a 70kg crate of fish up a very slippery loading ramp  
at a constant speed. The ramp is inclined 31 degrees to  
the horizontal. Determine the speed of the crate. (ignore  
friction)

$$V = ?$$

hint:  $4.29 \text{ m/s}$

$$\begin{aligned} F_{\text{down}} &= mg \sin(\theta) \\ &= 70(9.8) \sin(31) \\ &= 353 \text{ N} \end{aligned} \rightarrow F_{\text{up.}} \quad (\text{constant velocity})$$

$$P = \frac{W}{t}$$

$$1500 = \frac{W}{t}$$

$$\begin{aligned} 1500t &= Fd \\ 1500 &= 353 \left( \frac{d}{t} \right) \end{aligned}$$

$$1500 = 353 v$$

$$\frac{1500}{353} = v$$

$$4.29 \frac{\text{m}}{\text{s}} = v$$
