## **Common Ions and Their Charges**

A mastery of the common ions, their formulas and their charges, is essential to success in AP Chemistry. You are expected to know all of these ions on the first day of class, when I will give you a quiz on them. You will always be allowed a periodic table, which makes indentifying the ions on the left "automatic." For tips on learning these ions, see the opposite side of this page.

From the table:	
Cations	Name
H <sup>+</sup>	Hydrogen
H <sup>+</sup> Li <sup>+</sup>	Lithium
Na <sup>+</sup>	Sodium
K <sup>+</sup>	Potassium
Rb <sup>+</sup>	Rubidium
Rb <sup>+</sup>	Cesium
Be <sup>2+</sup>	Beryllium
Mg <sup>2+</sup>	Magnesium
Ca <sup>2+</sup>	Calcium
Ba <sup>2+</sup>	Barium
Sr <sup>2+</sup>	Strontium
Al <sup>3+</sup>	Aluminum
Anions	Name
H <sup>-</sup>	Hydride
H <sup>-</sup>	Fluoride
Cl	Chloride
Br <sup>-</sup>	Bromide
<b> </b> -	lodide
O <sup>2-</sup>	Oxide
S <sup>2-</sup>	Sulfide
S <sup>2-</sup> Se <sup>2-</sup>	Selenide
$N^{3-}$	Nitride
P <sup>3-</sup>	Phosphide
P <sup>3-</sup> As <sup>3-</sup>	Arsenide
Type II Cations	Name
Fe <sup>3+</sup>	Iron(III)
Fe <sup>2+</sup>	Iron(II)
Cu <sup>2+</sup>	Copper(II)
Fe <sup>2+</sup> Cu <sup>2+</sup> Cu <sup>+</sup>	Copper(I)
Co <sup>3+</sup>	Cobalt(III)
Co <sup>2+</sup>	Cobalt(II)
Sn <sup>4+</sup>	Tin(IV)
Sn <sup>2+</sup>	Tin(II)
Pb <sup>4+</sup>	Lead(IV)
Pb <sup>2+</sup>	Lead(II)
Hg <sup>2+</sup>	Mercury(II)
<u> </u>	

long to Momoriza		
Ions to Memorize		
Cations Ag <sup>+</sup>	Name Silver	
Zn <sup>2+</sup>		
Hg <sub>2</sub> <sup>2+</sup>	Zinc	
Hg <sub>2</sub>	Mercury(I)	
NH <sub>4</sub> <sup>+</sup>	Ammonium	
Aniono	Name	
Anions	Name Nitrite	
NO <sub>2</sub>		
NO <sub>3</sub> -	Nitrate	
SO <sub>3</sub> <sup>2</sup> - SO <sub>4</sub> <sup>2</sup> -	Sulfite	
SO <sub>4</sub> -	Sulfate	
HSO <sub>4</sub>	Hydrogen sulfate (bisulfate)	
OH.	Hydroxide	
CN <sup>-</sup>	Cyanide	
PO <sub>4</sub> <sup>3-</sup>	Phosphate	
HPO <sub>4</sub> <sup>2-</sup>	Hydrogen phosphate	
H <sub>2</sub> PO <sub>4</sub>	Dihydrogen phosphate	
NCS <sup>-</sup>	Thiocyanate	
CO <sub>3</sub> <sup>2-</sup>	Carbonate	
HCO <sub>3</sub>	Hydrogen carbonate (bicarbonate)	
CIO	Hypochlorite	
CIO <sub>2</sub>	Chlorite	
CIO <sub>3</sub>	Chlorate	
CIO <sub>4</sub>	Perchlorate	
BrO <sup>-</sup>	Hypobromite	
BrO <sub>2</sub> -	Bromite	
BrO <sub>3</sub>	Bromate	
BrO <sub>4</sub>	Perbromate	
IO <sup>-</sup>	Hypoiodite	
IO <sub>2</sub>	iodite	
IO <sub>3</sub>	iodate	
IO <sub>4</sub>	Periodate	
$C_2H_3O_2$	Acetate	
MnO₄⁻	Permanganate	
Cr <sub>2</sub> O <sub>7</sub> <sup>2-</sup>	Dichromate	
CrO <sub>4</sub> <sup>2-</sup>	Chromate	
O <sub>2</sub> <sup>2-</sup>	Peroxide	
$C_2O_4^{2-}$	Oxalate	
NH <sub>2</sub>	Amide	
NH <sub>2</sub> <sup>-</sup> BO <sub>3</sub> <sup>3-</sup>	Borate	
S <sub>2</sub> O <sub>3</sub> <sup>2-</sup>	Thiosulfate	

## Tips for Learning the lons

## "From the Table"

These are ions can be organized into two groups.

- 1. Their place on the table suggests the charge on the ion, since the neutral atom gains or loses a predictable number of electrons in order to obtain a noble gas configuration. This was a focus in first year chemistry, so if you are unsure what this means, get help BEFORE the start of the year.
  - a. All Group 1 Elements (alkali metals) lose one electron to form an ion with a 1+ charge
  - All Group 2 Elements (alkaline earth metals) lose two electrons to form an ion with a 2+ charge
  - c. Group 13 metals like aluminum lose three electrons to form an ion with a 3+ charge
  - d. All Group 17 Elements (halogens) gain one electron to form an ion with a 1- charge
  - e. All Group 16 nonmetals gain two electrons to form an ion with a 2- charge
  - f. All Group 15 nonmetals gain three electrons to form an ion with a 3- charge

Notice that cations keep their name (sodium ion, calcium ion) while anions get an "-ide" ending (chloride ion, oxide ion).

2. Metals that can form more than one ion will have their positive charge denoted by a roman numeral in parenthesis immediately next to the name of the

## **Polyatomic Anions**

Most of the work on memorization occurs with these ions, but there are a number of patterns that can greatly reduce the amount of memorizing that one must do.

- 1. "ate" anions have one more oxygen then the "ite" ion, but the same charge. If you memorize the "ate" ions, then you should be able to derive the formula for the "ite" ion and vice-versa.
  - a. sulfate is  $SO_4^{2}$ , so sulfite has the same charge but one less oxygen ( $SO_3^{2}$ )
  - b. nitrate is NO<sub>3</sub>, so nitrite has the same charge but one less oxygen (NO<sub>2</sub>)
- 2. If you know that a sufate ion is  $SO_4^{2-}$  then to get the formula for hydrogen sulfate ion, you add a hydrogen ion to the front of the formula. Since a hydrogen ion has a 1+ charge, the net charge on the new ion is less negative by one.

- 3. Learn the hypochlorite → chlorite → chlorate → perchlorate series, and you also know the series containing iodite/iodate as well as bromite/bromate.
  - a. The relationship between the "ite" and "ate" ion is predictable, as always. Learn one and you know the other.
  - b. The prefix "hypo" means "under" or "too little" (think "hypodermic", "hypothermic" or "hypoglycemia")
    - i. Hypochlorite is "under" chlorite, meaning it has one less oxygen
  - c. The prefix "hyper" means "above" or "too much" (think "hyperkinetic")
    - i. the prefix "per" is derived from "hyper" so perchlorate (hyperchlorate) has one more oxygen than chlorate.
  - d. Notice how this sequence increases in oxygen while retaining the same charge:
